

Annual Drinking Water Quality Report for Calendar Year 2024 Indian Creek Homeowners and Water Assn. IL1135250

This report is intended to provide you with important information about your drinking water and the efforts made by the water system to provide safe drinking water. This report includes drinking water facts, information on violations (if applicable), and contaminants detected in your drinking water supply during calendar year 2024. Each year, we will provide you a new report. If you need help understanding this report or have general questions, please contact the person listed below.

Sources of Drinking Water

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and groundwater wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Our source of water comes from Ground Water.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

Other Facts about Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline at (800) 426-4791.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

Source Water Assessments

Source water protection (SWP) is a proactive approach to protecting our critical sources of public water supply and assuring that the best source of water is being utilized to serve the public. It involves implementation of pollution prevention practices to protect the water quality in a watershed or wellhead protection area serving a public water supply. Along with treatment, it establishes a multi-barrier approach to assuring clean and safe drinking water to the citizens of Illinois. The Illinois EPA has implemented a source water assessment program (SWAP) to assist with wellhead and watershed protection of public drinking water supplies.

Indian Creek Homeowner and Water Association's susceptibility to groundwater contamination, a Well Site Survey, published in 1992 by the Illinois EPA, and Source Water Protection Plan were reviewed. Based on the information contained in these documents, no potential sources of groundwater contamination are present that could pose a hazard to groundwater pumped by the Indian Creek Homeowner and Water Association Community water supply well. Based upon this information, the Illinois EPA has determined that Indian Creek Homeowner and Water Association Well #1 is not susceptible to IOC, VOC, or SOC contamination. This determination is based on several criteria including monitoring conducted at the well; monitoring conducted at the entry point to the distribution system; and the available hydrogeologic data for the well. In anticipation of the U.S. EPA's proposed Ground Water Rule, the Illinois EPA has determined that Indian Creek Homeowner and Water Association's community water supply well is not vulnerable to viral contamination. This determination is based upon the evaluation of the following criteria during the Vulnerability Waiver Process: the community's well is properly constructed with sound integrity and proper site conditions; there is a hydrogeologic barrier that restricts pathogen movement; all potential routes and sanitary defects have been mitigated such that the source water is adequately protected; monitoring data did not indicate a history of disease outbreak; and the sanitary survey of the water supply did not indicate a viral contamination threat. However, having stated this, the U.S. EPA is proposing to require States to identify systems in karst, gravel, and fractured rock aquifer systems as sensitive. Water systems utilizing these aquifer types would be required to perform routine source water monitoring. Because the community's well is constructed in a confined aquifer, which should provide an adequate degree of protection to prevent the movement of pathogens into the well, well hydraulics wa

2024 Regulated Contaminants Detected

The next several tables summarize contaminants detected in your drinking water supply.

Here are a few definitions and scientific terms which will help you understand the information in the contaminant detection tables.

AL	Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
Avg	Regulatory compliance with some MCLs is based on running annual average of monthly samples.
MCL	Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the Maximum Contaminant Level Goal as feasible using the best available treatment technology.
MCLG	Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
MRDL	Maximum Residual Disinfectant Level: The highest level of disinfectant allowed in drinking water.
MRDLG	Maximum Residual Disinfectant Level Goal: The level of disinfectant in drinking water below which there is no known or expected risk to health. MRDLGs allow for a margin of safety.
N/A	Not Applicable
NTU	Nephelometric Turbidity Units
pCi/L	picocuries per liter (a measure of radioactivity)
ppb	Parts per billion or micrograms per liter (ug/L) - or one ounce in 7,350,000 gallons of water.
ppm	Parts per million or milligrams per liter (mg/L) - or one ounce in 7,350 gallons of water.
TT	Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.

Coliform Bacteria MCLG		Total Coliform MCL	Highest Number of	Fecal Coliform or E. coli MCL	Total No. of Positive E. coli or Fecal	Violation	Likely Source of Contamination
			Positive		Coliform Samples		
			Samples				
12	0	MCL: presence of coliform	0	Fecal Coliform or E. Coli MCL:	0	0	Naturally present in the environment
		bacteria in > 5% of monthly		A routine sample and a repeat			
		samples (for systems that		sample are total coliform			
		collect 40 or more		positive, and one is also fecal			
		samples/month).		coliform or E. coli positive			
		> 1 positive monthly sample					
		(for systems that collect <					
		40 samples/month).					

	Lead and C	Copper							
I		Date Sampled	MCLG	Action Level	90 th	# Sites Over	Units	Violation	Likely Source of Contamination
				(AL)	Percentile	AL			

Copper	08/04/2022	1.3	1.3	0.371	0	ppm	N	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
Lead	08/04/2022	0	15	4.24	0	ppb	N	Corrosion of household plumbing systems; erosion of natural deposits.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Indian Creek Homeowners and Water Assn. is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

Disinfectants & Disinfection	Collection	Highest Level	Range of Levels	MCLG	MCL	Units	Violation	Likely Source of Contamination
Byproducts	Date	Detected	Detected					
Chlorine	2024	1.5	1.2 - 1.7	MRDLG =	MRDL =	ppm	N	Water additive used to control microbes.
				4	4			
Total Trihalomethanes	2024	2.2	2.2 - 2.2	No goal	80	ppb	N	By-product of drinking water disinfection.
(TTHM)				for the				
				total				
Inorganic Contaminants								
Arsenic	2024	7.95	7.95-7.95	0	10	ppb	N	Erosion of natural deposits; Runoff from orchards;
								Runoff from glass and electronics production waste.
Barium	2024	0.274	0.2 74 -0.274	2	2	ppm	N	Discharge of drilling waste; Discharge from metals
								refineries; Erosion of natural deposits.
Fluoride	2024	0.51	0.51 - 0.51	4	4.0	ppm	N	Erosion of natural deposits; Water additive which
								promotes strong teeth; Discharge from fertilizer and
								aluminum factories.
Iron	2024	2.63	2.63 - 2.63		1.0	ppm	N	This contaminant is not currently regulated by the
								USEPA. However, the state regulates. Erosion of natural
								deposits.
Manganese	2024	29.8	29.8 - 29.8	150	150	ppb	N	This contaminant is not currently regulated by the
								USEPA. However, the state regulates. Erosion of natural
								deposits.
Sodium	2024	89100	89100 - 89100			ppb	N	Erosion from naturally occurring deposits. Used in water
								softener regeneration.
Radioactive Contaminants								Likely source of contamination.
Combined Radium	10/29/2023	0.82	0.82 - 0.82	0	5	pCi/L	N	Erosion of natural deposits.

Violation Summary Table

We are happy to announce that no monitoring, reporting, treatment technique, maximum residual disinfectant level, or maximum contaminant level violations were recorded during 2023.
